Applicants' Election, filed on or about 28 April 2003 has been duly considered. The Office's Restriction mailed on or about 08 April 2003 is held to have been proper with the exception that Claim 15 also is in Group I invention. That is Group I consists of Claims 1-8 and 11-14. Therefore in view of this holding and further in view of Applicants' response thereto the Restriction is hereby **made Final**. Applicants are required to cancel Group II (Claims 9 and 10) or take other appropriate action.

An Office Action on the merits of Claims 1-8 and 11-15 now follows.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-8 and 11-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Adlon et al.

Adlon et al teach an assembly for connecting electrical connectors to a multi-conductor cable. A robot feeds a connector to a nest. The connector has a housing with insulation-displacement terminals mounted therein. (Cf. Figure 1) . A cover holder holds the cover (12) Element 42 is denoted the press, cable feed station is 40, element 74 is the conductor checking device. The connection assisting means is construed as the element denoted as 60 which is operative for moving in a vertical axis perpendicular to a movable unit as the element labeled 56. It would have been obvious to sequentially press the wire pushing device and the cover holder if in fact Adlon et al do not teach the

same so that the wire arrives in the area in which it is to be electrically connected before the IDC terminals are pressed into the conductors. As applied to Claim 11 it would have been obvious to provide a reciprocably movable unit connected to connection assisting parts and operative to move connection assisting parts along a second axis substantially perpendicular to the pressing axis if in fact Adlon et al do not expressly teach this limitation inasmuch as Adlon et al do teach having a movable unit which has a broader range of motion than what Applicants have.
